Your notes are your context, and today they become a deck.

Ian Huff. Context & Creating, SHPE DFW AI for Engineers, Saturday 2026-10-17.

Log in now. Settings > Capabilities > code execution on.

Scan for the kit page

https://huffworks.github.io/shpe-blue-workshop/

Your notes already hold the context an assistant needs to work well.

Your notes are your context.

Engineers keep daily notes, drafts, meeting notes and research.

→

An agent that can see that folder reads all of it.

`memory/`

Memory files keep what you teach it once.

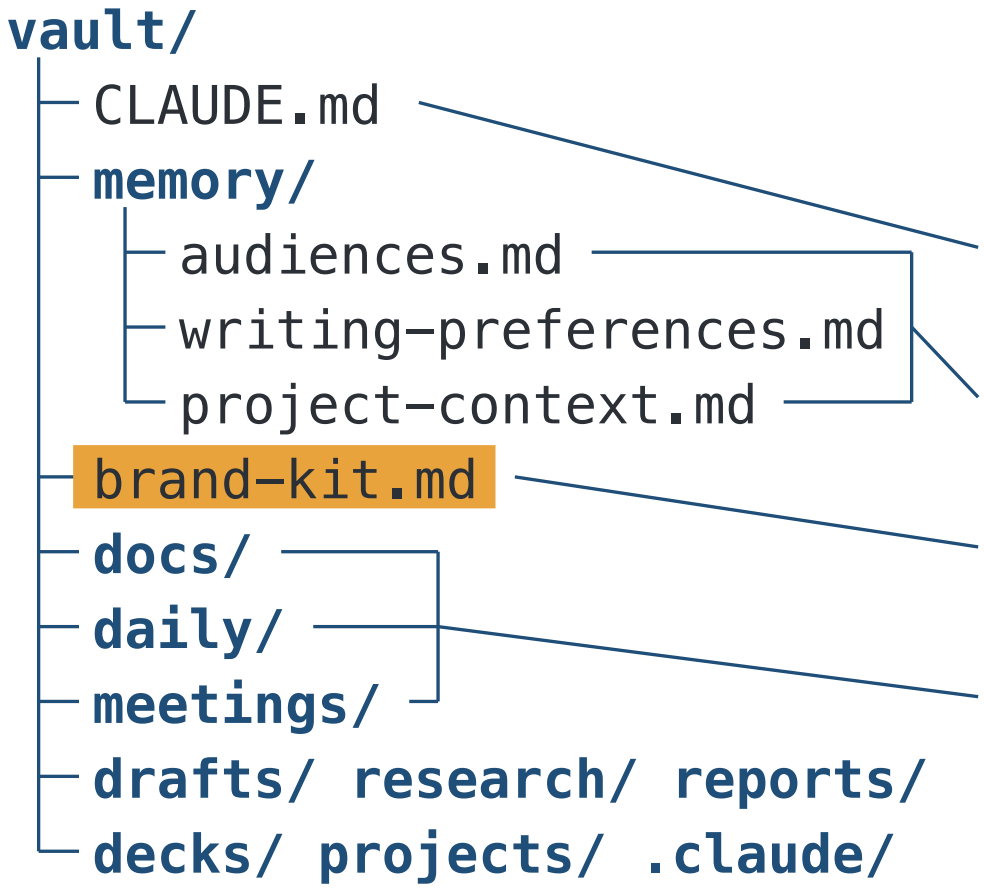

`CLAUDE.md`

House rules in one file shape every answer it gives.

`.claude/skills/`

Saved recipes, called skills, automate the work you repeat.

My vault is a plain folder of markdown notes with a brand kit inside.

The brand kit is one file, and it styles everything.

CLAUDE.md holds the house rules for every request.

memory/ holds audiences, writing preferences and project context.

brand-kit.md sets the colors, fonts, tone and slide rules.

docs/, daily/ and meetings/ hold the actual engineering work.

Plain text means any editor and any assistant can read it.

Everything I do on my Mac has a twin you can use in your browser.

In the demo (Ian's Mac)	In the hands-on (attendee browser)
`CLAUDE.md`	Project instructions
`vault files`	Project knowledge (pasted text)
`Claude Code chat`	Project chat
`add a memory line`	edit Project instructions
`memory file`	short rules go in Project instructions, long text in Project knowledge
`skill`	a 'When I say X, do this' block in the instructions

Project today, vault plus agent when you are ready.

1 The demo starts with a tour of my vault.

This is a chat box that can see my folder.

`CLAUDE.md`

Open CLAUDE.md and read two house rules aloud.

`memory/`

Open memory/ and show the three memory files.

`brand-kit.md`

Open brand-kit.md and point at the Values section.

`docs/`

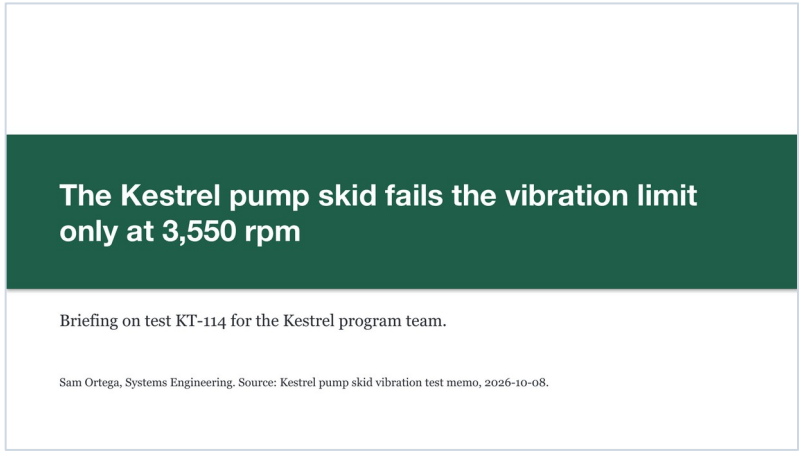

Open docs/ and show the three source documents.

2 The pump memo becomes a real .pptx in four minutes.

`docs/kestrel-pump-vibration-test-memo.md`

1. Drag the Kestrel pump memo from Finder into the chat.
2. Ask for a 5-slide briefing deck in Tarrant brand.
3. Claude writes and runs python-pptx, then returns the file.
4. Open the deck, then ask to see the code.

Rerun next month with new data.

`decks/kestrel-pump-briefing.pptx`

3 One memory line, and the next deck changes.

memory/audiences.md

```
– A limit or target beside every measured number saves a
round of questions.
```

Exec audiences want the ask on slide 1, not slide 5.

1. Open memory/audiences.md in the editor.
2. Add one line about exec audiences and save.
3. Ask for the same deck again for executives.
4. Compare slide 1 before and after the change.

The Kestrel pump skid fails the vibration limit only at 3,550 rpm

kestrel-pump-briefing.pptx

→

Decision needed: hold the 72-hour endurance run until the coupling retest passes

kestrel-pump-briefing-ask-first.pptx

4 A saved skill writes my weekly status report.

The deck recipe can be a skill too.

daily/ + [[links]]

- 2026-10-13.md
- 2026-10-14.md
- 2026-10-15.md
- 2026-10-16.md

→

`.claude/skills/status/SKILL.md`

↓

/status

→

reports/2026-10-16-weekly-status.md

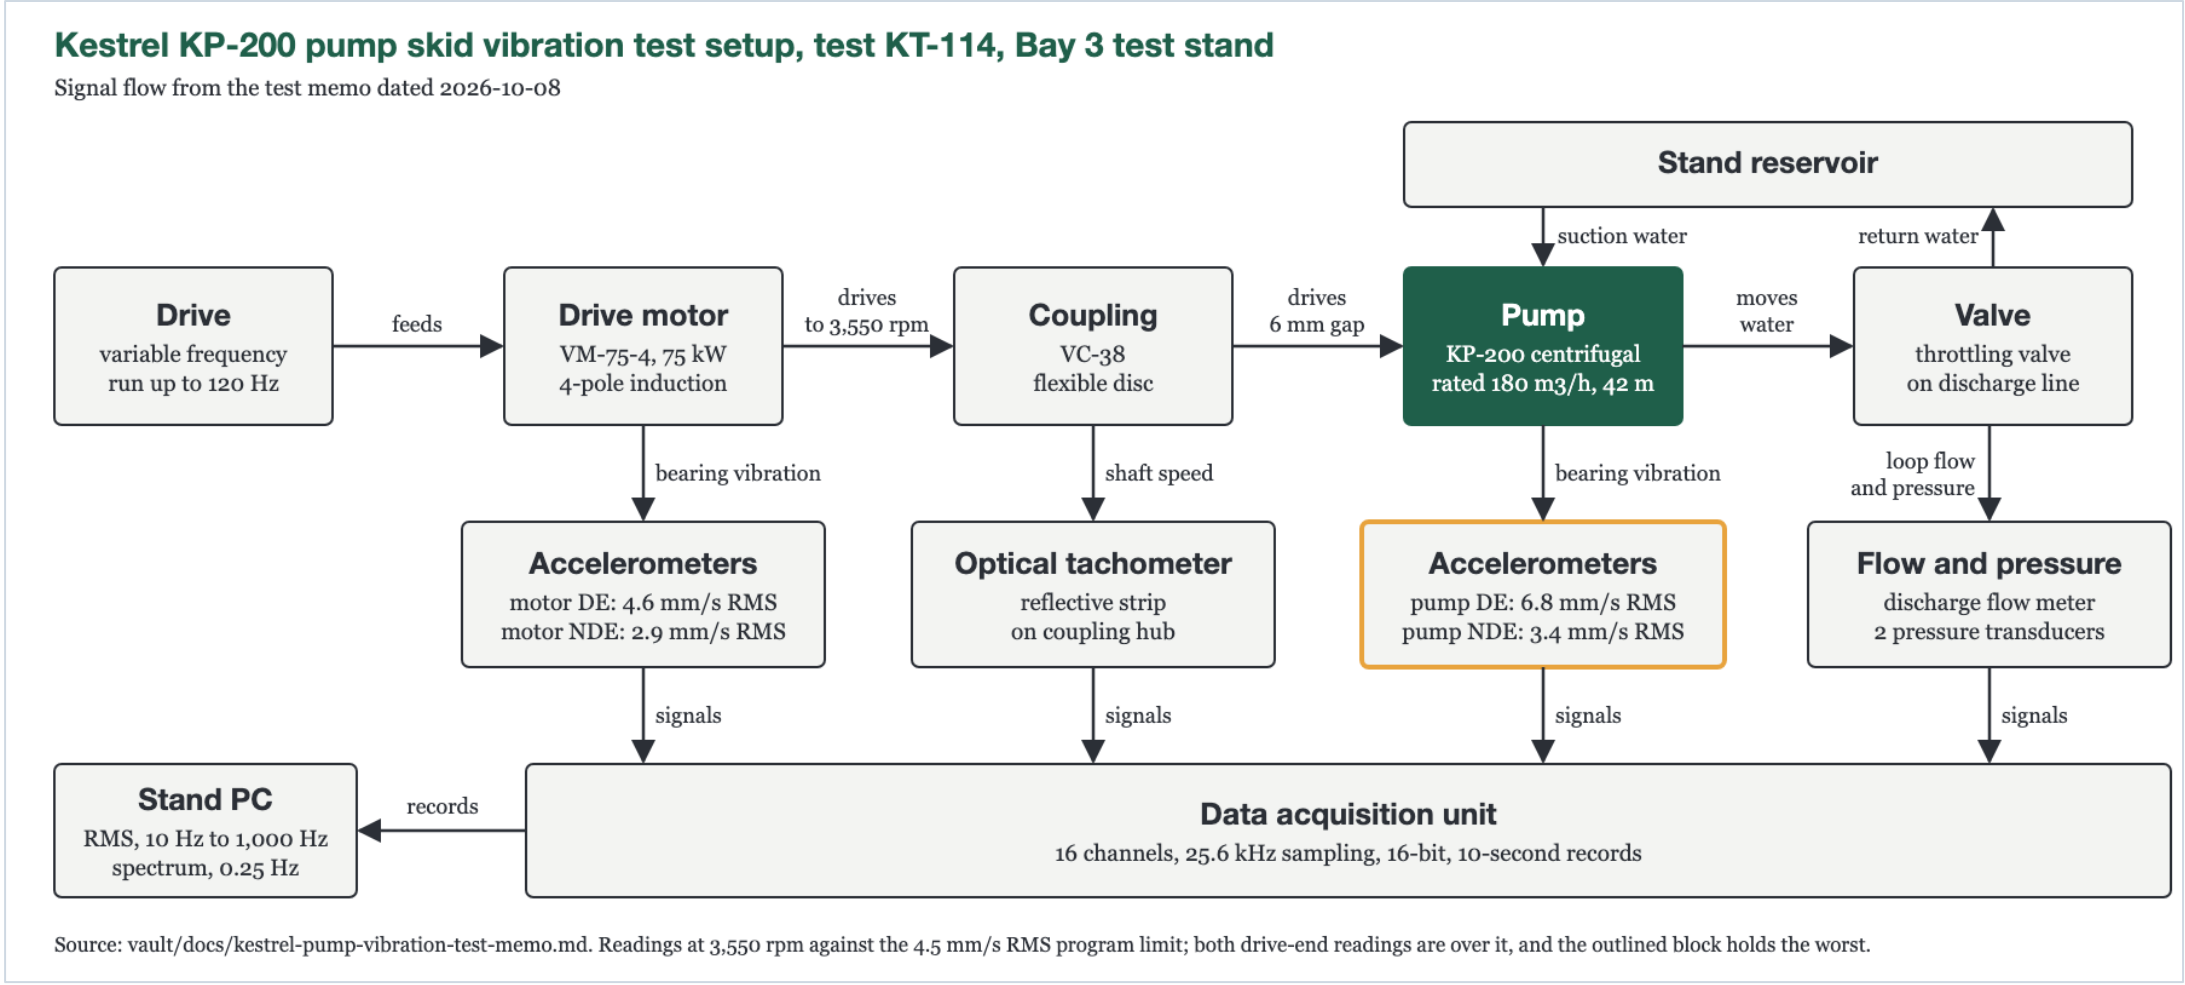

Weekly status, week ending 2026-10-16

From: Sam Ortega, Systems Engineering

To: Elena Ruiz, Dana Whitfield, Priya Nandakumar, Marcus Lee

1. Type /status in the Claude Code chat.
2. It reads this week's daily notes and follows their links into meetings/.
3. It writes the report to reports/ in the house voice.
4. Open the report and read the first two lines.

The same memo can also become a labeled system diagram in brand colors.

In pairs, you will rebuild the demo inside a browser Project in 20 minutes.

10:47	10:50	10:54	11:00	11:04

Min	Step
0-3	Make a Project. Paste the 5-line instructions template from the kit page and fill the blanks.
3-7	Paste the brand kit (Tarrant or personal template) and one sample doc into Project knowledge.
7-13	Ask for the 5-slide outline. Then: laptop with code execution asks for the .pptx and downloads it; phone asks for an SVG diagram in brand colors.
13-17	Add one rule to the Project instructions (examples on the kit page, such as "always flag numbers not in the source"). Start a new chat in the Project and ask again. Note what changed.
17-20	Share-outs: one thing that changed, one thing it got wrong.

This deck was built from my vault with the method you just used.

slides/brand-kit.md

```
## Values

- Primary: #1F4E79
- Secondary: #2B2F36
- Accent: #E8A33D
- Light: #F2F5F9
- Heading font: Helvetica Neue
- Body font: Georgia
```

One brand kit file drives the colors and fonts.

- A Python script reads the brand kit Values section.
- Change one hex color there, rerun, and the slides follow.
- Speaker notes and prompts live in the same script.
- The diagram slide came from the pump memo.

Project today, vault plus agent when you are ready.

Today: a Project with instructions, knowledge and chat.

- **Project instructions**
- **Project knowledge**
- **Project chat**

Later: a folder of notes and an agent that reads it.

```
vault/
├─ CLAUDE.md
├─ brand-kit.md
├─ memory/
└─ docs/ daily/ meetings/
```

Paste text, never upload files.

- Keep the cheat sheet; it has every prompt and option.
- Paste only non-confidential text into cloud tools.

Scan the kit page to keep every prompt, template and sample doc.

Project today, vault plus agent when you are ready.
